RESEARCH OBJECTIVE

Year 2 Computer Science (Data Science) student at Monash University Malaysia seeking an RA appointment to contribute to VR-based learning research. Brings proficiency in R, Python, and statistical modelling, alongside demonstrated academic writing ability across multi-source research reports. Actively developing PLS-SEM competency and keen to apply data analytics skills toward high-quality journal publications in Educational Technology.

EDUCATION

Bachelor of Computer Science (Data Science) 2024 – Present

Monash University Malaysia | Year 2

Relevant Coursework: Machine Learning, Data Analytics, Statistical Modelling, Database Systems

PROJECTS

AI-Powered Community Data System — LaporKita Jan 2026

Tools: Python, Firebase, Flutter

- Built a complaint management system with AI-based text categorisation and sentiment analysis on unstructured user input, aligning with UN SDG 11 and SDG 16.
- Implemented a clustering algorithm to surface widespread community issue patterns, grouping related entries across a live dataset.
- Presented at KitaHack 2026, a national hackathon organised by Google Developer Groups on Campus.

Predictive Modelling and Multi-Class Classification 2025

Tools: Python, Jupyter Notebook, Scikit-learn

- Established a clean modelling baseline through EDA, data wrangling, and feature preparation across a structured dataset.
- Applied SVM for multi-class classification via self-directed learning beyond coursework; trained and evaluated multiple models using train-test splitting and cross-validation.
- Compared classifiers across evaluation metrics to identify optimal performance; applied k-means clustering to reveal distinct population segments.
- Documented full methodology and findings in a structured analytical report following academic writing conventions.

Large-Scale Data Processing and Sentiment Analysis 2025

Tools: R, Unix BASH Shell

- Extracted sentiment trends and temporal activity patterns from a 1.47M-row compressed social media dataset using BASH pipelines — no permanent decompression required.
- Aggregated data across multiple fields to surface unique user counts, date ranges, and keyword frequency distributions.
- Conducted time-series analysis in R (POSIXct) linking activity spikes to real-world events; compiled outputs into structured CSV files via scripted pipelines.

Multi-Source Data Visualisation and Analytical Reporting 2025

Tools: Tableau

- Integrated two independent datasets across 19 years into a multi-chart analytical dashboard, identifying long-term performance and attendance trends.
- Selected and justified 8+ visualisation types (heatmap, bump chart, scatter plot, dual-layer area chart) based on specific analytical questions.
- Authored a formal written report covering data sources, design rationale, and interpretation of findings for a general audience.

TECHNICAL & CORE SKILLS

Statistical Software: R (proficient), SPSS (beginner), SmartPLS (beginner, actively developing PLS-SEM knowledge)

Statistical & Analytical Methods: Exploratory Data Analysis, Classification (SVM), Clustering (k-means), Sentiment Analysis, Time-Series Analysis, Model Evaluation, Descriptive Statistics

Programming & Tools: Python, SQL, Unix BASH Shell, Jupyter Notebook, Tableau, Git

Research Methodologies: Quantitative research, literature review, academic manuscript preparation, APA citation

CERTIFICATIONS

Prompt Design in Vertex AI — Google Cloud

Fundamentals of Deep Learning — NVIDIA

ACTIVITIES & INVOLVEMENT

Google Developer Groups on Campus (GDGoC), Monash University Malaysia 2024 – Present

- Participated in KitaHack 2026 national hackathon, developing an AI-powered solution using Google technologies.
- Attended developer community events, workshops, and technical sessions on applied data and AI systems.
